into sequences, which are receptors for interleaving 380 or 427 amino acid sequences, which are receptors for interleaving 380 or 427 amino acid sequences, which are receptors for interleukin-13 (Ir-13); the 380 or 427 amino acid sequences, which are designated II-13R beta and alpha respectively.

The IL-13R beta has high affinity for IL-13 while IL-13R alpha has low affinity, but acquires high affinity when associated with the IL-4 receptor. Nucleic acids encoding IL-13R beta and alpha are used as diagnostic probes to identify aberrant synthesis or genetic anomalies such as loss of heterozygosity and rearrangements, or chromosomal and alpha which can be used for production of recombinant IL-13R beta and alpha which can be used for production of recombinant IL-13R beta and alpha which can be used so IL-13 antagonists, specifically to regulate IL-13-induced responses for treatment of inflammation and relating yill-13-induced responses for treatment of inflammation and therapy (blocking synthesis of II-13R), Antibodies are used (in standard immunication and alpha such as a secondary (blocking synthesis of II-13R). Antibodies are used (in standard immunication and alpha such as a sociated with abnormal expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ó
                                                                                                                                                                                                                                                                                                                                             of IL-13 receptors; when coupled to a toxin also for treatment of overproduction of IL-13R. Cells that express IL-13R at the surface are used to identify ligands and modulators of IL-13R. Note: IL-13R beta is encoded by the nucleic acid sequence shown in Figure 2a in the specification (AAT86464), which is not the same as that shown in the sequence listing (AAT85828).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Interleukin-13; IL-13; interleukin-13 receptor binding chain; IL-13bc; mediator; IL-13 receptor binding inhibition; IgE-mediated condition; allergy; asthma; immune complex disorder.

The present sequence represents the human interleukin-13 (IL-13) binding chain of the interleukin-13 receptor, designated IL-13bc IL-13bc acts a mediator of the known biological activities of IL-13bc. IL-13bc acts an endiator of the known biological activities of IL-13bc. IL-13bc proteins, and antibodies raised against them, are used to inhibit the binding of IL-13 to its receptor. They are particularly used to treat ign-mediated conditions, e.g. allergy, asthma and immune complex disorders, especially lugus, nephritis, thyroiditis and Grave's disease. They are also used to treat immune deficiency (particularly in heartopoletic progenitor cells), cancer etc. and to increase macrophage activation, e.g. in vaccination. To potentiate IL-13 activity, a protein with such activity is combined with IL-13bc and the mixture applied, in vivo, to a cell expressing at least one chain of the IL-13 receptor coher than IL-13bc. IL-13bc can also be used in diagnosis to detect expression of IL-13, its receptor or binding chain, and to raise specific antibodies which may be useful for treating some tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          121 SSWAETTYWISPQGIPETKVQDMDCVYYNWQYLLCSWKPGIGVLLDTNYNLFYWYEGLDH 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a novel ligand-binding receptor, Zcytor2, which shares homology with cytokine receptors and was isolated from human placental polyper placents are perceptor for placental polyper polypeptide is a preceptor for cytokines (particularly interleukin-13) and is expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands that promote proliferation and/or differentiation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor,

```
ö
This protein comprises a novel human cytokine/peptide hormone receptor, designated the HR-1 receptor, that shows 27% identity and 52% similarity to the interleukin-5 receptor. Its amino acid sequence was deduced from a CDNA clone (see AAV04131) obtained from a claimed nest cells, and used in a claimed method for identifying compounds which bind to, and activate or inhibit, it. HR-1 ceceptor activators and activate or inhibit, it. HR-1 ceceptor activators and agonists can be used to treat, prevent or diagnose predisposition to lowered resistance to infection, asthma, allergic or haematopoietic disorders, e.g. where induced by AIDS, aplastic anaemia, neutropaenia or cytotoxic treatments for cancer. HR-1 antagonists, e.g. antibodies or HR-1 receptor frequents. can be used to treat conditions associated with HR-1 receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HFKECTVEYELKYRNIGSETWKTIITKNLHYKDGFDLNKGIEAKIHTLLPWQCTNGSEVQ 120

This protein comprises a novel human cytokine/peptide hormone receptor, designated HR-1 receptor. The amino acid sequence was deduced from a cDNA clone (see AAV04075) isolated from a human testis cDNA library. It shows 27% amino acid identity and 52% similarity with the human interleukin-5 receptor. Also claimed are polynucleotides encoding HR-1 receptor, vector and host cells, an agonist to the polypeptide, antibody against the polypeptide, an antagonist that inhibits the activity of the polypeptide, a process for diagnosing a disease, or a susceptibility to disease, related to expression of HR-1 receptor, and a method for identifying compounds that activate or inhibit the HR-1 receptor. HR-1 receptor protein and polynucleotides can be used for research, compounds that activate or inhibit the HR-1 receptor. HR-1 receptor protein and polynucleotides can be used for research, increase resistance to infections in individuals with trauma and/or burns, and to prevent, ameliorate, treat, diagnose and/or determine the matchopoiesis induced by AIDS, aplastic anaemia, congenital or cyclic neutropaemia and/or bone marrow transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 HFKECTVEYELKYRNIGSETWKTIITKNLHYKDGFDLNKGIEAKIHTLLPWQCTNGSEVQ 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that of the human cytokine/peptide hormone receptor treat, prevent or diagnose predisposition to lowered resistance to infection, asthma, allergic or hematopoietic disorders, e.g. where induced by acquired immune deficiency syndrome (AIDS), aplastic anaemia, neutropaenia or cytokoxic treatments for cancer. Antagonists of the receptor, e.g. antibodies or fragments of it may be used to treat conditions associated with overexpression of the HR-I receptor, e.g. those listed above. Antibodies may also be used to assay levels of HR-I receptor, overexpression of which may be diagnostic of tumours, by usual immunoassays; to isolate and identify HR-I receptor-expressing cells; or for affinity purification of the HR-I receptor-expressing cells; or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 HFKECTVEYELKYRNIGSETWKTIITKNLHYKDGFDLNKGIEAKIHTLLPWQCTNGSEVQ 120

            the harm testis cDNA clone (see AAA77912). IL-13bc is a member of the harmatopoietin receptor family that acts as a mediator of the harmatopoietin receptor family that acts as a mediator of IL-13D convertion of IL-13bc polypeptides, including claimed full-length production of IL-13bc polypeptides, including claimed full-length in-13bc, its extracellular domain, and its intracellular domain.

IL-13bc polypeptides, particularly soluble IL-13bc polypeptides, and IL-13 receptor inhibitors (e.g. antagonists of the interaction which IL-13 and its receptor) can be used to treat conditions and diseases including atopy, allergy, asthma, immune complex diseases.

(e.g. lupus, nephrotic syndrome, nephritis, glomerulonephritis, thyroiditis and cracer. Since IL-13 inhibits macrophage activation, IL-13bc proteins can also be used to enhance macrophage activation, IL-13bc proteins can also be used to enhance macrophage activation, IL-13bc proteins or parasite infections. IL-13bc proteins in vivo as diagnostic agents, and to screen for agents capable of binding to IL-13bc or IL-13 receptor, or which interfere with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 HFKECTVEYELKYRNIGSETWKTIITKNLHYKDGFDLNKGIEAKIHTLLPWQCTNGSEVQ 120

The protein of the invention is useful for treating tissue fibrosis resulting from infection with Schistosoma or from healing of a wound which is a surgical incision, or from healing of a wound which is a surgical incision, or as liver, skin epidermis and endodermis, which affects tissues such cardiac tissue, pancreas, lung, uterine tissue, neural tissue, testis, ovary, adrenal gland, artery, vein, colon, small intestine, billary tract and gut. It is also used in the treatment or modulation of various IL-13 related conditions such as allergic conditions, methrotic syndrome, thyroiditis, Grave's disease and cancer.

binding chain of IL-13 receptor (IL-13bc). IL-13bc protein is used
to potentiate the effects of IL-13. This protein is also used to
enhance macrophage activation and hence can be used in vaccination
or treatment of mycobacterial or parasitic infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of treating fibrosis in a mammal by administering an interleukin-13 (IL-13) antagonist or an IL-4 antagonist. In particular, the IL-13 antagonist is the IL-13 binding chain (IL-13bc; AAB29747, AAB29748) of the IL-13 receptor (IL-13R), or soluble fragments thereof. The method is useful for treating or inhibiting the formation of tissue fibrosis resulting from the healing of a wound, including a surgical incision wound, or from infection with schistosoma. The method may be used to treat fibrosis in a variety of tissues, particularly liver tissue, but also skin epidermis, skin endodermis, muscle, tendon, cartilage, cardiac tissue, pancreatic tissue, lung tissue, uterine tissue, neural tissue, testis, ovary, adrenal gland, artery, vein, colon, small intestine, biliary tract or gut tissue. The present sequence represents human IL-13bc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating or inhibiting tissue fibrosis resulting from infection with schistosoma and wound healing involves administering interleukin-13 or

The resulting polypeptide is a receptor for cytokines (particularly interleukin-13) and is expressed on the surface
                                                                                                                                                                             61 HFKECTVEYELKYRNIGSETWKTIITKNLHYKDGFDLNKGIEAKIHTLLPWQCTNGSEVQ 120

           be used to detect ligands that promote proliferation and/or differentiation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor,
testicular cells, probably being involved in spermatogenesis. It can

                                                                                                                      The IL-13 binding protein and related therapeutic molecules can be used in the antagonism of at least one IL-13 activity. They can be used for treating IL-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered IL-13 after IL-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autoimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool.

This sequence represents a novel ligand-binding receptor, 2cytor2,
which shares homology with cytokine receptors and is isolated from
testis tissue obtained from a celebus macaque. The resulting polypeptide
is a receptor for cytokines (particularly interleukin-13) and is
cypressed on the surface of testicularly interleukin-13) and is
expressed on the surface of testicular cells, probably being involved in
spermatogenesis. It can be used to detect ligands promoting proliferation
condition differentiation of such cells in cultures and amy also be used to
treat infertility. Antagonists of this receptor may be used to
characterise ligand-receptor interactions and as male-specific
contraceptives. By blocking the action of IL-13, receptor antagonists and
ligand-binding this receptor can as a diagnostic to determine
function, e.g. in allergy and asthma, as a diagnostic to determine
circulating levels of ligand and also to isolate and purify ligands.
Thibodies can be used to assay circulating receptor (an abnormal level
may be indicative of disease such as cancer), for labelling cells that
express the receptor, and therapeutically as antagonist.

IL-13bc acts a mediator of the known biological activities of IL-13bc. IL-13bc acts a mediator of the known biological activities of IL-13bc. IL-13bc acts at IL-13bc proteins, and antibodies arised against them, are used to inhibit the binding of IL-13 to its receptor. They are particularly used to treat igE-mediated conditions, e.g. allergy, asthma and immune complex disorders, especially lupus, nephritis, thyroiditis and Grave's disease. They are also used to treat immune deficiency (particularly in hammatopoietic progenitor cells), cancer etc., and to increase macrophage activation, e.g. in vaccination. To potentiate IL-13 activity, a protein with such activity is combined with IL-13bc and the mixture applied, in vivo, to a cell expressing at least one chain of the IL-13 receptor contribute than IL-13bc. IL-13bc and indiagnosis to detect expression of IL-13, its receptor or binding chain, and to raise specific antibodies which may be useful for treating some tumours.
                                                                                                                         Interleukin-13; IL-13; interleukin-13 receptor binding chain; IL-13bc; mediator; IL-13 receptor binding inhibition; IgE-mediated condition; allergy; asthma; immune complex disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid encoding interleukin-13 receptor binding chain and transformed cells - proteins, antibodies and inhibitors, for treating immunoglobulin E-mediated diseases, e.g. Graves disease,

The present sequence is that of the interleukin-13 binding chain

(IL-13bc) of the murine IL-13 receptor, as deduced from an isolated

(IL-13bc) of the murine IL-13 receptor, as deduced from an isolated

(IL-13bc) mouse thymus cDNA clone (see AAA27911). IL-13bc is a member

of the haematopoletin receptor family that acts as a mediator of

IL-13. The invention provides methods for the recombinant

production of IL-13bc polypeptides, including claimed full-length

IL-13bc, its extracellular domain, and its intracellular domain.

IL-13bc polypeptides, particularly soluble IL-13bc polypeptides,

and IL-13 receptor inhibitors (e.g. antagonists of the interaction

of IL-13 and its receptor) can be used to treat conditions and

diseases including atopy, allergy, asthma, immune complex diseases

of IL-13 is implicated, particularly IgE-mediated conditions and

diseases including atopy, allergy, asthma, immune complex diseases

thyroidits and Grave's disease), lung inflammation,

immunodeficiency, and cancer. Since IL-13 inhibits macrophage

activation, IL-13bc proteins can also be used to enhance macrophage

activation, e.g. in vaccination, treatment of mycobacterial or
                                                                            New polynucleotide encoding an interleukin-13 (IL-13) binding chain of an IL-13 receptor for treating IgE-mediated conditions, such as atopy, asthma, Grave's disease and inflammatory conditions of the lung -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    intracellular organisms or parasite infections. IL-13bc proteins may also be used to potentiate the effects of IL-13 in vitro and in vivo, as diagnostic agents, and to screen for agents capable of binding to IL-13bc or IL-13 receptor, or which interfere with the binding of IL-13 to its receptor.
                                                                                                                                                                                          Claim 11(a); Page 50-51; 60pp; English.

-!- FUNCTION: BINDS AS A MONOMER WITH HIGH AFFINITY TO INTERLEUKIN-13 (ILL-13), BUT NOT TO IL-4.

-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

-!- SUBCELLULARITY: CONTAINS I FERRONECTIN TYPE III-LIKE DOMAIN.

-!- SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.

SUBDCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SPECIFICITY: SPLEEN, LIVER, THYMUS, HEART, LUNG, KIDNEY, TESTIS, STOWACH, BRAIN, SKIN, AND COLON; BUT NOT SKELETAL MUSCLE. SIMILARITY: CONTAINS I IMMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.
SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-NOV-1997 (Rel. 35, Created)

Submitted (SEP-1999) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: BINDS IL-13 WITH A LOW AFFINITY. TOGFFHER WITH IL-4R-ALPH CAN FORM A FUNCTIONAL RECEPTOR FOR IL-13. ALSO SERVES AS AN ALTERNATE ACCESSORY PROYEEN TO THE COMMON CYTOKINE RECEPTOR GAMMA CHAIN FOR IL-4 SIGNALING, BUT CANNOT REPLACE THE FUNCTION OF GAMMA-C. IN ALLOWING ENHANCED IL-2 BINDING ACTIVITY.
-!-SUBMIT: INTERLEMENT-13 RECEPTOR IS A COMPLEX OF IL4R-ALPHA, IL13R-ALPHA, AND POSSIBLY OTHER COMPONENTS.
-!-SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Receptor; Transmembrane; Glycoprotein; Immunoglobulin domain; Signal. SIGNAL 1 \ 21 \  POTENTIAL.
                                                                                                                                                                                                                                                                                                                                                TISSUE SPECIFICITY: UBIQUITOUS. HIGHEST LEVELS IN HEART, LIVER, SKELETAL MUSCLE AND OVARY; LOWEST LEVELS IN BRAIN, LUNG AND KIDNEY. ALSO FOUND IN B-CELLS, T-CELLS AND BUDOTHELIAL CELLS. SIMILARITY: CONTAINS 1 IMMUNGLOBULIN-LIKE C2-TYPE DOMAIN. SIMILARITY: CONTAINS 1 FIBRONECTIN TYPE III-LIKE DOMAIN. SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         INTERLEUKIN-13 RECEPTOR ALPHA-1 CHAIN

```
-i- SUBUNT: THE GAMMA CHAIN IS COMMON TO THE IL-2, IL-4, IL-7 AND PROBBLY ALSO THE IL-13 RECEPTORS.
-i- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-i- DISEASE: DEFECTS IN ILZER ARE THE CAUSE OF A SEVERE COMBINED IMMUNODEFICIENCY, WHICH IS KNOWN AS AGAMMAGLOBULINEMIA, SWISS TYPE OR X-LINKED SEVERE COMBINED IMMUNODEFICIENCY DISEASES (KSCID).
-i- SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.
-i- SIMILARITY: CONTAINS I FIBRONECTIN TYPE III-LIKE DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Puck J.M., Pepper A.E., Bedard P. M., Laframboise R.; "Female germ line mosaicism as the origin of a unique IL-2 receptor gamma-chain mutation causing X-linked severe combined immunodeficiency."; J. Clin. Invest. 95:895-899(1995).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "Atypical X-linked severe combined immunodeficiency due to possible spontaneous reversion of the genetic defect in T cells."; New Engl. J. Med. 335:1563-1567(1996).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       "B-cell-negative severe combined immunodeficiency associated with a common gamma chain mutation."; Hum.
